

electron/code-city-model.cjs

Kind: added · Baseline: NovaDiff-main · Target: NovaDiff · Generated: 2026-05-14T06:30:59.211Z

Overview

This diff represents a folder comparison between two trees on disk, with NovaDiff-main as the baseline (left) and NovaDiff as the target (right). The file being analyzed is electron/code-city-model.cjs. The change kind is added (new file only in target; no deletions from baseline), and the line changes are +176/-0.

Key changes

The following functions were added or modified:

- `buildSideNodes` : This function takes a side (baseline or target) and returns an object containing arrays of files and symbols.
- `buildCodeCityModelPayload` : This function takes the left and right roots, labels, changes, and loadOutline functions as arguments and returns an object containing the generatedAt timestamp, baselineLabel, targetLabel, files, symbols, and authors.

Impact

The impact of these changes is likely to be minor, but it's important to note that the `buildSideNodes` function now includes a `dominantAuthor` property for each file and symbol, which may affect the calculation of the Code City model's authorship metrics. Additionally, the `buildCodeCityModelPayload` function now includes a `generatedAt` property, which can be used to track when the payload was generated.

Risks & follow-ups

There are no obvious risks or issues with these changes, but it's always a good idea to verify that the new functionality works as expected. It would also be helpful to review the diff excerpt to ensure that all relevant changes have been accounted for.
