

electron/diff-excerpt.cjs

Kind: added · Baseline: NovaDiff-main · Target: NovaDiff · Generated: 2026-05-14T06:31:22.497Z

Overview

This diff introduces a new file `electron/diff-excerpt.cjs` with two functions `buildDiffExcerpt` and `buildDiffExcerptChunks`. The former generates a compact diff text for LLM context, while the latter splits the output into chunks based on a maximum length per chunk.

Key changes

The most significant implementation change is the addition of the `buildDiffExcerptChunks` function, which allows for more efficient rendering of large diffs by breaking them down into smaller chunks. Additionally, the `buildDiffExcerpt` function now includes a `maxLenPerChunk` parameter to allow for customization of the chunk size.

Impact

The impact of these changes should be minimal, as they primarily serve to improve the performance and scalability of the diff rendering process. However, it's worth noting that the `buildDiffExcerptChunks` function may introduce some regression risk if it is not properly tested or integrated with existing code.

Risks & follow-ups

- Regression risk:** The new `buildDiffExcerptChunks` function may introduce unexpected behavior or bugs if it is not thoroughly tested or integrated with existing code. To mitigate this risk, we recommend running the JS/TS lint, test, and production build commands used by this repo to ensure that the changes do not introduce any new issues. Additionally, we suggest verifying that the `buildDiffExcerptChunks` function behaves correctly for a variety of input scenarios.
- Verification:** We recommend verifying that the `buildDiffExcerptChunks` function behaves correctly for a variety of input scenarios to mitigate the regression risk.
