

electron/preload.cjs

Kind: modified · Baseline: NovaDiff-main · Target: NovaDiff · Generated: 2026-05-14T06:40:33.279Z

Overview

This diff represents a modification to the `electron/preload.cjs` file in the NovaDiff repository. The file is part of the Electron context bridge and exposes various IPC functions to the renderer process.

Key changes

The most significant change in this diff is the addition of new IPC functions for managing window state, such as minimizing, maximizing, and closing the window. These functions are exposed through the `electronAPI` object in the renderer process. Additionally, the diff includes changes to the `llmSummarizeStream` function, which now includes a handler for the `LLM_STREAM` event emitted by the LLM module.

Impact

The impact of these changes on correctness, maintainability, performance, compatibility, or observability is not immediately apparent. However, the addition of new IPC functions may introduce new opportunities for security vulnerabilities or other issues that need to be carefully reviewed and tested.

Risks & follow-ups

Based on the evidence provided, there is no clear indication of any potential risks or issues with the changes made to the `electron/preload.cjs` file. However, it is important to verify that the new IPC functions do not introduce any security vulnerabilities or other issues that could negatively impact the overall stability or functionality of the application. As such, it would be advisable to run the JS/TS lint, test, and production build commands used by this repo to ensure that all tests pass and there are no unexpected issues.
