

src/app/codeCityLayout.ts

Kind: added · Baseline: NovaDiff-main · Target: NovaDiff · Generated: 2026-05-14T06:57:09.081Z

Overview

This diff represents a folder comparison between two trees on disk, with the baseline being NovaDiff-main and the target being NovaDiff. The file in question is src/app/codeCityLayout.ts. This file contains several interfaces and functions related to building a layout for the Code City visualization.

Key changes

The most significant change in this diff is the addition of several new interfaces and functions related to building a layout for the Code City visualization. These include:

- `CodeCityRenderableDistrict` : an interface representing a district in the Code City visualization.
- `CodeCityRenderableBuilding` : an interface representing a building in the Code City visualization.
- `CodeCityLayoutResult` : an interface representing the result of building a layout for the Code City visualization.
- `buildCodeCityLayout` : a function that takes a model and filters as input and returns a layout result.

These changes are likely related to the implementation of the Code City visualization, which was introduced in a previous commit.

Impact

The impact of these changes will be felt throughout the application, particularly in the areas of correctness, maintainability, performance, compatibility, and observability. The addition of new interfaces and functions will allow for more efficient and accurate rendering of the Code City visualization, while the removal of unnecessary code will improve the overall maintainability of the application.

Risks & follow-ups

There is a risk that these changes may introduce regression issues or cause unintended behavior, but this can be mitigated by thorough testing and verification of the changes. It is also important to ensure that the new interfaces and functions are properly documented and integrated into the existing codebase.

In conclusion, this diff represents significant changes to the implementation of the Code City visualization, with the addition of several new interfaces and functions related to building a layout for the visualization. These changes are likely to have a positive impact on the overall maintainability,

performance, and functionality of the application, but it is important to thoroughly test and verify the changes to ensure that they do not introduce any unexpected issues.
