

src/app/codebaseDocs.ts

Kind: added · Baseline: NovaDiff-main · Target: NovaDiff · Generated: 2026-05-14T06:57:45.068Z

Overview

This diff represents a folder change between two trees on disk, with NovaDiff as the target and NovaDiff-main as the baseline. The file being analyzed is src/app/codebaseDocs.ts. This file contains functions related to generating documentation for a codebase, such as building prompt context and metrics markdown.

Key changes

The following changes were made in this file:

- Added new functions `buildCodebaseMetricsMarkdown` and `codebaseExtensionPieMermaid`.
- Modified existing function `sampleFilePaths` to include a cap parameter.
- Modified existing function `depthHistogram` to use a Map data structure.
- Added new function `codebaseDepthMermaid`.
- Changed import-like lines, export/public-surface lines, and cited changed lines.

Impact

The impact of these changes is likely to be minimal, as they are primarily focused on improving the performance and maintainability of the codebaseDocs module. The addition of new functions may provide more flexibility and customization options for users who want to generate documentation for their codebase.

The modification of the `sampleFilePaths` function allows for a more efficient way of generating sample file paths, which could potentially improve the performance of the codebaseDocs module. The use of a Map data structure in the `depthHistogram` function also provides a more efficient way of storing and retrieving data, which could potentially improve the performance of the codebaseDocs module.

Risks & follow-ups

There is a risk that these changes may introduce bugs or compatibility issues with older versions of the NovaDiff module. To verify this, we should run the JS/TS lint, test, and production build commands used by this repo. Additionally, we should ensure that the new functions and modifications work as expected and do not cause any unintended side effects.
