What it doesThe `dependencies` section declares the runtime libraries the project needs.- Core graph functionality is provided by `@novadiff/graph-core` and `@novadiff/graph-view` (local packages).- Layout engines such as `@dagrejs/dagre`, `elkjs`, and `d3-force` are included for graph drawing.- `graphology` and its community detection plugin `graphology-communities-louvain` supply graph data structures and analysis tools.- UI components come from `react`, `react-dom`, `@xyflow/react`, `react-window`, `lucide-react`, and `zustand` for state management.- Markdown rendering uses `react-markdown`, `marked`, `remark-gfm`, and `rehype-sanitize`.- `mermaid` and `three` add diagram and 3-D rendering capabilities.- `devlop` is a dev-only helper for hot reloading.

How it worksWhen `npm install` or `yarn install` runs, each listed package is fetched from npm (or the local file path for the `@novadiff/*` packages). The lockfile ensures the exact minor/patch versions (`^` ranges) are resolved. At runtime, the application imports these modules to build and render graphs, process markdown, and manage UI state. The `file:` entries allow local development of the graph core and view modules without publishing them.

Notes for reviewers- The caret (`^`) ranges mean the build will accept any compatible minor/patch updates; confirm that this aligns with the team's version-stability policy.- The choice of both `@dagrejs/dagre` and `elkjs` suggests multiple layout strategies; verify that both are actively used.- `devlop` is a dev-only dependency; ensure it is listed under `devDependencies` if not required at runtime.- Unknown from the snippet: why `graphology-communities-louvain` is included—check if community detection is a core feature.
