

electron/preload.cjs

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:20:21.502Z

Overview

The preload script `electron/preload.cjs` now exposes four new IPC helpers. They are added at lines 45-46 and 152-155 and use the same `ipcRenderer.invoke` pattern as the existing API.

Key changes

- `scanSecurityInsights(payload)` – lines 45-46 – invokes `"security-insights-scan"`.
- `gitListBranches(payload)` – lines 152-152 – invokes `"git-list-branches"`.
- `gitListBranchCommits(payload)` – lines 153-153 – invokes `"git-list-branch-commits"`.
- `workspaceMaterializeCommit(payload)` – lines 154-155 – invokes `"workspace-materialize-commit"`.

All four helpers are simple wrappers that return the promise from `ipcRenderer.invoke`.

Impact

- **Correctness:** Calls will reject if the main process lacks a handler for the corresponding channel; this is standard IPC behavior.
- **Maintainability:** Adding helpers in this consistent style keeps the preload API cohesive.
- **Performance:** The wrappers add negligible overhead beyond normal IPC latency.
- **Compatibility:** Existing renderer code is unaffected; no breaking changes.

Risks & follow-ups

- **Missing main handlers** – verify that `"security-insights-scan"`, `"git-list-branches"`, `"git-list-branch-commits"`, and `"workspace-materialize-commit"` are implemented in the main process.
- **Type definitions** – update TypeScript typings or add JSDoc comments for the new functions.
- **Testing** – add unit/integration tests that exercise these IPC calls to guard against regressions.
