

electron/workspace-history.cjs

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:22:32.415Z

Overview

`electron/workspace-history.cjs` now imports two additional helpers from `git-service.cjs` (`listBranches`, `listCommitsForRef`) and introduces a new function, `materializeCommitForCompare`. This helper resolves a Git ref or hash to a snapshot path, creating the snapshot if it does not already exist. The module's export list is updated to expose the new function and the two imported helpers.

Key changes

- **Import expansion** – line 6 now pulls `listBranches` and `listCommitsForRef` from `git-service.cjs`.
- **New function** – `materializeCommitForCompare` (lines 295-314) resolves a ref or hash, checks for an existing usable snapshot, and if missing, creates one via `snapshotCommit`.
- **Export list update** – lines 316-324 add `listBranches`, `listCommitsForRef`, and `materializeCommitForCompare` to `module.exports`.

Impact

- Other modules can now call `materializeCommitForCompare` to obtain a snapshot path for any commit or branch reference, simplifying comparison workflows.
- The added imports make `listBranches` and `listCommitsForRef` available for use within this file or exported for external use.

Risks & follow-ups

- **Missing helper definitions** – Ensure `git-service.cjs` actually exports `listBranches` and `listCommitsForRef`; otherwise imports will fail at runtime.
- **Error handling** – `materializeCommitForCompare` throws if the workspace is missing or the ref is empty; callers must handle these errors.
- **Snapshot creation side-effects** – The function creates a snapshot directory if absent; verify that this behavior aligns with the intended workflow and that no unintended snapshots are produced.
- **Testing** – Add unit tests covering the new function's success and failure paths, and confirm that the export list reflects the changes.
