

package.json

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:12:05.712Z

Overview

The `package.json` in the `NovaDiff` branch updates the Electron runtime and its builder. Electron is bumped from `^34.2.0` (removed at L56) to `^42.2.0` (added at R56). Electron-builder is bumped from `^25.1.8` (removed at L57) to `^26.8.1` (added at R57). No other dependencies were modified.

Key changes

- **Electron runtime** – line 56 now requires `electron@^42.2.0`.
- **Electron-builder** – line 57 now requires `electron-builder@^26.8.1`.
- The `build` script (`"electron:build": "npm run rust:build && npm run build && electron-builder"`) remains unchanged.

Impact

- The new Electron version may introduce API changes that affect renderer code.
- Native modules (if any) must be rebuilt against the new Electron headers.
- Packaging behavior could change with the newer electron-builder defaults.

Risks & follow-ups

- **Build failures** – Run `npm ci && npm run build && npm run electron:build` on all target platforms to catch native module errors.
- **CI pipeline** – Update any Docker/VM images to match the new Electron version; ensure `node-gyp` uses the correct headers.
- **Release artifacts** – Verify generated installers for missing resources or signing issues.
