

packages/graph-core/src/ignore-filter.ts

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:41:17.002Z

Overview

The `DEFAULT_IGNORE_PATTERNS` array in `packages/graph-core/src/ignore-filter.ts` now contains two new glob patterns. The changes appear in the diff at lines 16–17: `".venv-*/"` and `"**/site-packages/"`. No other parts of the file were modified.

Key changes

- Added `".venv-*/"` to ignore any directory whose name starts with `.venv-` (e.g., `.venv-3.10`).
- Added `"**/site-packages/"` to ignore any `site-packages` directory anywhere under the project tree.
- The ignore-filter construction (`createIgnoreFilter`) and its exported interface remain unchanged.

Impact

- Projects that contain Python virtual environments or nested `site-packages` directories will be excluded from analysis by default, reducing noise.
- The default ignore list is still centralized; future additions can follow the same pattern.
- Custom `.novadiffignore` files still override these defaults via negation, as described in the function comment.

Risks & follow-ups

- Verify that legitimate directories named `.venv-...` or `site-packages` that are not Python environments are not unintentionally ignored.
- Ensure the glob `"**/site-packages/"` does not match unintended paths (e.g., a folder named `site-packages` in a non-Python context).
- Run the existing test suite and a sample scan on a mixed-language repository to confirm that the new defaults do not break analysis.
- Update any documentation that lists default ignore patterns to reflect the new entries.
