

packages/graph-view/src/NovaDiffGraphExplorer.tsx

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:47:06.703Z

Overview

The `NovaDiffGraphExplorerProps` interface in `packages/graph-view/src/NovaDiffGraphExplorer.tsx` was extended with three optional properties: `detailLevel`, `showFunctionsInClassView`, and `cityFilterNodeIds`. These additions appear in the diff at lines 38-42 of the interface and are documented with comments that reference Code City structure filters.

Key changes

- **New props** added in the interface (lines 38-42).
- Each prop is preceded by a comment explaining its intended use.
- No other parts of the file were modified; the component's implementation remains unchanged.

Impact

- **Type-level:** Consumers now have additional optional configuration options. Existing code continues to compile because the new fields are optional.
- **Runtime:** The component does not read these props in the current implementation, so no new runtime behavior or performance impact is introduced.
- **Compatibility:** The change is non-breaking; it only expands the public API.
- **Observability:** No new logs or metrics are emitted; the rendering path is unchanged.

Risks & follow-ups

- **Consumer migration:** Projects importing `NovaDiffGraphExplorerProps` may need to update documentation to reflect the new fields.
- **Documentation:** Ensure README and prop-type docs mention the added options.
- **Unused props:** Verify that downstream code does not assume these props are present; they are currently ignored.
- **Future usage:** Plan for a future implementation that consumes these props while keeping the interface stable until then.
