

packages/graph-view/src/utils/performance.ts

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:54:04.090Z

Overview

A new module `packages/graph-view/src/utils/performance.ts` adds shared performance thresholds and helper functions for graph rendering and ELK layout handling.

Key changes

- **Constants**
 - `GRAPH_VISIBLE_ONLY_MIN_NODES` (R4) = 100.
 - `GRAPH_ELK_WORKER_MIN_NODES` (R10) = `Number.POSITIVE_INFINITY`.
- **Functions**
 - `shouldOnlyRenderVisibleGraphElements` (R12-R20) returns `false` until `layoutReady`, then checks `nodeCount >= GRAPH_VISIBLE_ONLY_MIN_NODES`.
 - `shouldRunElkInWorker` (R22-R24) always returns `false`, disabling worker mode.
 - `countElkLayoutNodes` (R26-R39) recursively counts nodes in a nested `children` array.

Impact

- Off-screen node pruning is now enabled for graphs with ≥ 100 nodes, potentially reducing DOM size.
- ELK worker mode is disabled (R10) to avoid hangs in Electron embeds, as noted in comment lines 7-8.
- The new exports are available for import across the repository.

Risks & follow-ups

- The 100-node threshold may need tuning; verify against typical graph sizes.
- Monitor layout performance for graphs larger than `GRAPH_ELK_WORKER_MIN_NODES` (currently infinite).
- Validate `countElkLayoutNodes` with deeply nested structures to ensure correct node counts.
- Ensure no modules import the old `performance.ts` path; update imports if necessary.
