

Overview

`src/app/docsQuality.ts` now separates heuristic and advisory risk signals.

The confidence-badge logic and the release-overview markdown generation have been rewritten to use these two source categories, replacing the previous single-signal check.

Key changes

- `deriveConfidenceBadges` (lines 75-152)
 - Added `heuristicSignals` and `advisorySignals` filters (diff lines 111-113).
 - New badge logic:
 - `high-risk-signals` is triggered only by high-severity *heuristic* signals (diff line 115).
 - `risk-signals` is added when any heuristic signal exists (diff line 122).
 - `advisory-signals` is added when any advisory signal exists (diff lines 128-135).
 - Removed the old `else if (riskSignals.length > 0)` branch (diff line 118).
- `**`buildRelease`

Overview

Markdown` (lines 153-260)**

- Extracts `advisorySignals` at line 163.
- Replaces the static advisory status paragraph (lines 245-246) with a dynamic message that shows the count of advisory findings or notes their absence (diff lines 256-258).
- All other sections remain unchanged but now reference the new `advisorySignals` array.
- Function signatures are unchanged.

Impact

- The high-risk badge now reflects only heuristic signals, preventing false positives from advisory data.
- An `advisory-signals` badge and an advisory enrichment status section provide clearer insight into advisory coverage.
- The code now explicitly separates heuristic and advisory sources, simplifying future extensions.

Risks & follow-ups

- Verify that `heuristicSignals` and `advisorySignals` are correctly populated when all signals share the same source.

- Ensure the advisory enrichment status renders correctly when `advisorySignals.length === 0`.
- Confirm that badge keys remain unique; duplicate keys are suppressed by the `push` helper.
