

src/app/gitHistoryBranches.ts

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:30:50.318Z

Overview

A new module `src/app/gitHistoryBranches.ts` is added, providing utilities for enriching branch commits, selecting default branches, creating synthetic tip commits, resolving repository roots, and formatting branch option labels.

Key changes

- **Imports:** `GitBranchSummary`, `GitLogCommitSummary` from `./gitTypes` (R1) and `WorkspaceCommitSnapshot` from `./workspaceTypes` (R2).
- **`enrichBranchCommits`** (R4-R20): maps `GitLogCommitSummary[]` to `WorkspaceCommitSnapshot[]`, using a `Map` for O(1) lookup; missing commits receive placeholder fields.
- **`pickDefaultBaseBranch`** (R25-R38): selects a preferred base branch (`main`, `master`, `develop`) or falls back to the first local or any branch.
- **`pickDefaultHeadBranch`** (R40-R53): prefers the current branch, then the active branch, then any local branch.
- **`commitFromBranchTip`** (R56-R66): creates a synthetic `WorkspaceCommitSnapshot` for a branch tip.
- **`resolveGitRepoRoot`** (R68-R77): resolves the repo root from an override, live-dev root, or workspace root.
- **`branchOptionLabel`** (R79-R89): formats a branch name with short hash and tags (`current`, `remote`).

Impact

- Centralizes branch-related logic, reducing duplication across the codebase.
- Exposes utilities for UI components and tests, simplifying future refactors.
- `enrichBranchCommits` builds a `Map` for efficient lookup, keeping enrichment linear in commit count.

Risks & follow-ups

- **Type safety:** confirm that `GitBranchSummary` and `WorkspaceCommitSnapshot` definitions match usage in all consumers (unknown from the available diff).
- **Branch selection logic:** verify behavior when no local branches exist (unknown from the available diff).
- **Synthetic commit timestamps:** `new Date().toISOString()` may affect downstream code (unknown from the available diff).

- **Build & lint:** run the repo's lint, test, and production build scripts to catch integration issues introduced by the new file (unknown from the available diff).
