Overview

The file `src/app/gitTypes.ts` now declares three new exported interfaces: `GitBranchSummary`, `GitBranchListResult`, and `GitLogCommitSummary`. These additions appear at lines 129-136, 138-141, and 143-148 respectively.

Key changes

- `GitBranchSummary` (lines 129-136) adds the required property `isRemote: boolean` to the existing branch descriptor (`name`, `hash`, `shortHash`, `upstream`, `isCurrent`).
- `GitBranchListResult` (lines 138-141) introduces a container type exposing `currentBranch: string` and `branches: GitBranchSummary[]`.
- `GitLogCommitSummary` (lines 143-148) defines a lightweight commit view with `hash`, `shortHash`, `subject`, and `authoredAt`.

All three interfaces are exported, expanding the public type surface without removing any existing symbols.

Impact

- Code that constructs a `GitBranchSummary` must now provide `isRemote`; otherwise TypeScript will report a missing property.
- The new interfaces give a consistent shape for branch and commit metadata, which can reduce duplication in the codebase.
- No existing public APIs are altered; the changes are additive and should not break consumers that rely on the old types.

Risks & follow-ups

- Verify that all branch-listing functions populate `isRemote`; missing values will cause compile-time errors.
- Ensure any serialization/deserialization logic for branch data includes the new `isRemote` field.
- Check components that render commit summaries to use `GitLogCommitSummary` instead of ad-hoc shapes.
- Run the full test suite to confirm that no tests fail due to the new required property.
