

Overview

`graphCityBridge.ts` was refactored to centralize node-id parsing and simplify several helper signatures. The new `parseSymbolNodeRest` (added at R16) extracts `filePath` and `symbolName` from a node-id suffix, handling numeric suffixes and colon-separated paths. `parseGraphNodeId` now delegates function and class parsing to this helper (R45-50).

Key changes

- `parseSymbolNodeRest` – new helper (R16-34).
- `parseGraphNodeId` – updated to use `parseSymbolNodeRest` (R45-50).
- `graphNodeToCityBuildingIds` – signature changed to `(_rootSide?: CodeCityRootSide)` (R78-82). Added logic (R95-102) to infer missing `symbolName / kind` from the graph node.
- `filePathForLinkedSelection` – removed `rootSide` parameter (R229-233) and simplified to use the parsed node ID or graph node file path.
- `cityBuildingIdsForHighlight` – added optional `cityBuildingId` (R287-358). Logic now prefers this ID when supplied and updates the highlight set accordingly.
- `cityBuildingToGraphNodeId` – uses a candidate list of possible IDs (R139-148) to improve robustness.
- `buildBuildingIdByGraphNode` – `rootSide` made optional (R165).
- `graphNodeIdsForCityLayout` – new export (R264-285) that collects all graph node IDs corresponding to visible CodeCity buildings, including parent file nodes for non-file buildings.

Impact

- **Correctness** – Centralized parsing reduces duplicate logic; missing symbol names are now inferred from the graph node.
- **Maintainability** – Optional parameters reduce coupling to `rootSide`.
- **Compatibility** – Call sites must be updated to match the new optional arguments.
- **Performance** – Minor overhead from the candidate list lookup in `cityBuildingToGraphNodeId`; overall impact negligible.

Risks & follow-ups

- **API breakage** – Verify all imports of the affected functions; update call sites to use the new optional parameters.
- **Parsing edge cases** – Ensure `parseSymbolNodeRest` correctly handles paths containing colons or numeric suffixes; run unit tests covering such cases.
- **Highlight logic** – Confirm that the new `cityBuildingIdsForHighlight` still produces the expected primary/secondary highlights in focus mode.

- **Graph node ID collection** – Validate that `graphNodeIdsForCityLayout` does not miss or duplicate IDs, especially for non-file buildings.
