

Overview

`src/app/types.ts` now exports three new security-related types. They are added at lines 173-187 and do not modify any existing logic.

Key changes

- **SecurityScanSourceState** (line 173) – a string literal union: `"ok" | "warning" | "error" | "skipped"`.
- **SecurityScanSourceStatus** (lines 175-180) – an interface with:
`source: string; state: SecurityScanSourceState; message: string;`
and an optional `durationMs?: number`.
- **SecurityInsightReport** (lines 182-186) – an interface that aggregates:
`scannedAt: string; signals: RiskSignal[]; sources: SecurityScanSourceStatus[]`.

Impact

- The public type surface now includes the three new exports.
- No executable code is added, so existing runtime behavior is unchanged.
- Compile-time effects are unknown from the available diff.

Risks & follow-ups

- Check for unused imports of the new types to avoid lint warnings.
- Add unit tests that build `SecurityInsightReport` objects to confirm type safety.
- Update any documentation or API references to include the new types.
