

src/components/CodeMapLoadingPreview.css

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:35:38.161Z

Overview

A new stylesheet `src/components/CodeMapLoadingPreview.css` (267 lines added) introduces the visual scaffolding for the Code-Map loading preview. The file defines the `.code-map-loading-preview` component and its sub-elements (`__viewport`, `__stars`, `__horizon`, `__mesh`, `__beam`, `__console`, `__title`, `__tracks`, etc.).

Key changes

- **Toast-bar suppression** – the rule `body:has([data-code-map-loader]:not(.is-exiting)).background-activity-bar { visibility: hidden; opacity: 0; pointer-events: none; }`

- **Component styles** – the new CSS defines layout, colors, and animations for the loader UI.
- **Animations** – keyframes ``code-map-mesh-sweep``, ``code-map-track-indeterminate``, ``code-map-viewport-exit``, and ``code-map-console-exit`` drive the loader's transitions.
- **Reduced-motion media query** – disables the mesh animation and shortens exit animations for users who prefer reduced motion (lines 258-267).
- **Modern CSS features** – the file uses ``:has()``, ``color-mix``, radial gradients, and mask images.

Impact

- The loader now overlays the bottom HUD and suppresses duplicate toast bars, preventing visual duplication.
- All styles are scoped to the `.code-map-loading-preview`` namespace, reducing the risk of leaking into unrelated components.
- The added CSS is lightweight; GPU-accelerated animations are used where supported.

Risks & follow-ups

- **Toast bar visibility** – it is unknown from the diff whether the suppression rule might hide essential notifications in edge cases.
- **Browser support** – the use of ``:has()`` and ``color-mix`` requires modern browsers; confirm compatibility in the target environment.
- **Animation timing** – ensure the exit animations do not interfere with other page transitions.
- **Test coverage** – add tests to verify that the CSS classes are applied and that the toast bar is hidden during loading.
