Overview

`src/components/HistoryCompareStrip.tsx` was refactored from a commit-centric UI to a branch-centric one. The component now receives branch metadata instead of commit snapshots, removes commit-specific helpers, and updates the UI text and interaction patterns accordingly.

Key changes

- **Imports**
 - L8 removed: `import type { WorkspaceCommitSnapshot } ...`
 - R8 added: `import type { GitBranchSummary } from "../app/gitTypes"`
 - R9 added: `import { branchOptionLabel } from "../app/gitHistoryBranches"`
- **Props (`HistoryCompareStripProps`)**
 - Removed: `commits` , `baseHash` , `headHash` , `indexing` , `onBaseHash` , `onHeadHash` , `onLiveRepoRoot` .
 - Added: `branches` , `branchesLoading` , `branchLoadError` , `baseBranch` , `headBranch` , `loading` , `onBaseBranch` , `onHeadBranch` .
- **Helper functions**
 - Lines 30-37 (`truncateSubject`) and 38-41 (`commitLabel`) were deleted.
- **UI updates**
 - Header text changed to "Change history" (L72-73).
 - Labels now refer to *branches* (L81-90).
 - Select elements use IDs `git-history-base-branch` / `git-history-head-branch` (L105-106, L174-175) and populate options via `branchOptionLabel` (L117-124, L191-194).
 - Swap button disabled logic now checks `loading` / `branchesLoading` (L138-140).
 - Live toggle label updated to "Compare base branch against live dev folder" (R220).
 - Compare button `aria-label` changed to "Compare branches" (R230).
- **Logic changes**
 - `canCompare` now relies on branch metadata (`baseMeta` , `headMeta`) and loading flags (L62-66, L58-61).

Impact

- **API:** Callers must switch from commit hashes to branch names; TypeScript errors will surface if unchanged.
- **Branch lookup:** Replaces commit lookup; the array size is typically smaller.
- **Error handling:** `branchLoadError` is displayed after the compare button (L241).

Risks & follow-ups

1. **API breakage** – Existing components that passed commit hashes will fail to compile.
2. **Missing branch metadata** – If `branches` lacks a matching `baseBranch` / `headBranch`, `canCompare` will be false; verify fallback UI.
3. **`branchOptionLabel` import** – Ensure the symbol is exported; otherwise the build fails.
4. **Accessibility** – Test the new `aria-label` values with screen readers.
