

src/components/InsightsWorkspace.tsx

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:39:33.466Z

Overview

A new component `InsightsWorkspace` is added in `src/components`. It provides a security-insights workspace that runs heuristic and advisory scans, stores the user's advisory-scan preference, and displays findings grouped by category.

Key changes

- **Imports** (lines 1-6): React hooks (`useCallback` , `useEffect` , `useMemo` , `useState`), types (`FileChange` , `RiskSignal` , `SecurityInsightReport`), and helpers `groupSecuritySignals` , `mergeRiskSignals` from `../app/securityInsights`.
- **loadAdvisoryDefault** (lines 10-17): Reads the `novadiff_insights_advisory_enabled` flag from `localStorage` , defaulting to `false`.
- **InsightsWorkspaceProps** (lines 18-24): Declares props for comparison status, root paths, change rows, and a jump callback.
- **RiskSection** (lines 26-81): Renders a risk category with optional "Open diff" buttons.
- **State & effects** (lines 90-106): Manages heuristic/advisory signals, loading, errors, and persists `advisoryEnabled` to `localStorage`.
- **Scan callbacks** (`runHeuristicScan` , `runAdvisoryScan` , lines 108-196): Call `window.electronAPI.scanRiskSignals` and `scanSecurityInsights` , handling cancellation, errors, and state updates.
- **Signal merging & grouping** (lines 209-213): Uses `mergeRiskSignals` and `groupSecuritySignals` to prepare data for rendering.
- **UI rendering** (lines 215-319): Shows controls, loading states, error alerts, source lists, and four `RiskSection` instances for vulnerabilities, dependencies, memory leaks, and function completeness, plus an optional "Other" section.

Impact

- Requires `window.electronAPI` to expose `scanRiskSignals` and `scanSecurityInsights` ; otherwise scans fail.
- Persists the advisory-scan toggle in `localStorage` ; failures are ignored silently.
- Scans run asynchronously; UI may block while awaiting results, especially for large diffs.
- Centralizes risk logic, simplifying future updates to signal handling.

Risks & follow-ups

- **Electron API availability**: Verify that `window.electronAPI` implements the expected methods.
- **LocalStorage errors**: Ensure graceful degradation when storage access throws (e.g., in incognito).

- **Signal merging logic:** Confirm that `mergeRiskSignals` deduplicates and prioritizes findings; add tests for edge cases.
- **UI rendering:** Check that all risk categories render correctly, even when empty, and that the "Other" section appears only when needed.
