

src/components/sidebar/sidebarTiming.ts

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:43:40.468Z

Overview

`src/components/sidebar/sidebarTiming.ts` now contains four exported timing constants that control the sidebar's debounce, erase fallback, width transition, and forced-collapse durations. The file was added in lines R1-R12, with JSDoc comments describing each constant.

Key changes

- `export const SIDEBAR_LEAVE_DELAY_MS = 160;` – debounce delay before erase starts after pointer/focus leaves (R2).
- `export const SIDEBAR_ERASE_FALLBACK_MS = 580;` – maximum wait for label erase before panel width closes (R5).
- `export const SIDEBAR_WIDTH_TRANSITION_MS = 320;` – CSS width transition duration on `.launch-panel--side` / `.sidebar` (R8).
- `export const SIDEBAR_FORCE_COLLAPSE_MS = SIDEBAR_ERASE_FALLBACK_MS`
- `SIDEBAR_WIDTH_TRANSITION_MS;` – total duration for a full collapse used during navigation (R11-R12).
- Descriptive JSDoc comments added for each constant (R1, R4, R7).

Impact

- **Maintainability** – centralizes timing values, reducing duplication.
- **Consistency** – all sidebar animations reference the same durations, preventing visual glitches.
- **Observability** – exposed constants can be logged or monitored if needed.
- **Build** – the file is pure TypeScript; it compiles with existing linting and test suites.

Risks & follow-ups

- **Unused export** – no imports of these constants were detected in the current scan; verify that they are integrated into the sidebar logic before use.
- **Animation sync** – ensure that any hard-coded durations elsewhere match the new `SIDEBAR_FORCE_COLLAPSE_MS` value to avoid timing mismatches.
- **Performance** – constants are trivial; confirm that the added file does not introduce lint or build warnings that could affect CI.
- **Documentation** – update any design docs or README sections that previously listed hard-coded timing values.
