

src/components/sidebar/useWorkspacePageWithSidebar.ts

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:44:50.476Z

Overview

A new hook `useWorkspacePageWithSidebar` is added to `src/components/sidebar/useWorkspacePageWithSidebar.ts` (lines R1-62). It centralizes logic for switching workspace pages while coordinating with the sidebar's collapse state.

Key changes

- **Imports:** Lines R1-R3 add React hooks (`useCallback` , `useEffect` , `useRef` , `useState`) and type imports for `WorkspacePage` and `UseSidebarExpandResult` .
- **Hook signature:** `export function useWorkspacePageWithSidebar(sidebar: Pick<UseSidebarExpandResult, "panelExpanded" | "requestCollapse">)` (R5-R6). Only panel state and collapse request are required.
- **State & refs:** `workspacePage` and `stagePage` (`useState<WorkspacePage>`), `pendingStageRef` (`useRef<WorkspacePage | null>`), `collapseGenerationRef` (`useRef(0)`).
- **flushStage** (R13-R16): clears `pendingStageRef` and updates `stagePage` .
- **scheduleStageLoad** (R18-R41): if the sidebar is collapsed, flushes immediately; otherwise queues the page, increments a generation counter, and waits for `sidebar.requestCollapse()` to resolve before flushing only if the generation and pending page match.
- **setWorkspacePage** (R43-R49): updates `workspacePage` and triggers `scheduleStageLoad` .
- **Effect** (R51-R55): on panel expansion, if a pending stage exists, it flushes it immediately.
- **Return** (R57-R61): `{ workspacePage, stagePage, setWorkspacePage }` .

Impact

- Coordinates page changes with sidebar collapse, reducing UI glitches.
- Encapsulates sidebar-aware logic in a single hook, simplifying component code.
- Uses `useCallback` and refs to avoid unnecessary re-renders and handle async collapse without race conditions.

Risks & follow-ups

- **Race condition:** `collapseGenerationRef` prevents stale `requestCollapse` resolutions from flushing an outdated page; verify correctness.
- **Panel state propagation:** callers must pass the correct `panelExpanded` flag; otherwise pending stages may be lost.
- **Cleanup:** the hook does not clear pending stages on unmount; confirm this is acceptable.
- **Testing:** add unit tests for `scheduleStageLoad` and the effect to cover collapsed vs. expanded scenarios.
