

src/vite-env.d.ts

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:24:38.755Z

Overview

The `src/vite-env.d.ts` file now imports `SecurityInsightReport` from `./app/types` (line 13) and extends the `ElectronAPI` interface with a new `scanSecurityInsights` method (lines 186-190). This expands the renderer-to-main API surface to support security-insight scanning.

Key changes

- **Import added:** `SecurityInsightReport` from `./app/types` (line 13).
- **API method added:** `scanSecurityInsights`: (payload: { projectRoot: string; changes: FileChange[]; advisoryEnabled?: boolean; }) => Promise;

- No other interface members were modified.

Impact

- **Compile-time:** Code that imports `ElectronAPI` will now require the new method; missing implementation will cause type errors.
- **Runtime:** The main process must expose `scanSecurityInsights` via the preload script; otherwise renderer calls will fail.
- **Testing:** Mocks of `ElectronAPI` need to include the new method to avoid undefined errors.
- **Documentation:** API docs and README snippets should be updated to reflect the new capability.

Risks & follow-ups

- **Missing implementation:** If the main process or preload script does not expose `scanSecurityInsights`, renderer calls will throw at runtime.
- **Type leakage:** Ensure `SecurityInsightReport` is exported from its module; otherwise imports will fail.
- **Backward compatibility:** Existing code that accesses `electronAPI` without checking for the new method may compile but fail if the method is absent. Add optional chaining or guard checks where appropriate.
- **Test coverage:** Update unit tests that mock `ElectronAPI` to include the new method; otherwise tests may pass locally but fail in CI where the mock is stricter.
