

tests/graphCityBridge.test.ts

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:17:34.324Z

Overview

The `graphCityBridge` test suite was extended to cover additional edge-case scenarios. New imports and tests validate line-suffix handling, missing graph nodes, and graph-node visibility logic.

Key changes

- **Import added:** `graphNodeIdsForCityLayout` is now imported at line 7.
- **Test “maps disambiguated function node ids with line suffix”** (lines 113-131) checks that a node id such as `function:src/a.ts:foo:42` maps to the city building `target:src/a.ts:function:foo:1`.
- **Test “highlights from city building id when graph node is missing”** (lines 133-141) verifies that `cityBuildingIdsForHighlight` returns a primary id and highlights related buildings even when the graph argument is `null`.
- **Test “collects graph node ids for visible city buildings”** (lines 146-155) ensures `graphNodeIdsForCityLayout` returns a set containing the file and function nodes but excludes unrelated class nodes.
- Minor formatting adjustments keep test imports consistent.

Impact

- **Correctness:** The added tests confirm that line-suffix node ids resolve correctly and that missing graph data is handled without errors.
- **Maintainability:** Centralizing node-id collection in `graphNodeIdsForCityLayout` reduces duplication across tests.
- **Observability:** New tests surface regressions in mapping logic early in CI.
- **Compatibility:** No API changes; only test coverage expansion.

Risks & follow-ups

- If `graphNodeToCityBuildingIds` or `cityBuildingIdsForHighlight` are modified elsewhere, the new tests may fail; run the full suite after such changes.
- Ensure `graphNodeIdsForCityLayout` is exported correctly; otherwise the tests will error.
- Verify that `cityBuildingIdsForHighlight` accepts a `null` graph without throwing; the test covers this but may require defensive coding.
