

tests/securityInsights.test.ts

Kind: added · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:17:50.607Z

Overview

A new test file, `tests/securityInsights.test.ts` (added lines 1-51), has been introduced to validate the `groupSecuritySignals` and `mergeRiskSignals` utilities defined in `src/app/securityInsights`.

Key changes

- **Imports:** The file imports `vitest` helpers, the `RiskSignal` type, and the two functions under test.
- **Helper `mk`:** Provides a minimal `RiskSignal` constructor with default values, simplifying test data creation.
- **Grouping test:** Asserts that signals of categories `dependency-cve`, `memory-leak`, and `function-completeness` are placed into the `vulnerabilities`, `memoryLeaks`, and `functionCompleteness` arrays respectively.
- **Merging test:** Checks that signals sharing the same `id` are deduplicated, keeping the newer signal's `title` and `source`.

Impact

- The tests enforce the expected grouping and deduplication behavior of the utilities, helping maintain consistency.
- The concise `mk` helper keeps test data readable and facilitates future test extensions.
- No public API changes are introduced; the tests exercise existing functionality.

Risks & follow-ups

- Unknown from the available diff/scan evidence whether `groupSecuritySignals` or `mergeRiskSignals` depend on mutable state; review the implementation for side-effects.
- Current tests cover typical scenarios; consider adding cases for empty inputs or signals with missing optional fields.
- Verify that the new test file is included in the test runner configuration and run `vitest` locally to confirm.
- If the `RiskSignal` type evolves, update the `mk` helper accordingly.
