

vite.config.ts

Kind: modified · Baseline: 9aadd5eb5604 · Target: NovaDiff · Generated: 2026-05-26T19:13:17.715Z

Overview

A single line was added to `vite.config.ts` (line 57) to include the `three/webgpu` package in Vite's `optimizeDeps.include` array.

Key changes

- `optimizeDeps.include` now contains `"three/webgpu"` (added at line 57).
- No other configuration values were altered.

Impact

- **Development mode:** Vite will pre-bundle `three/webgpu`, ensuring the module is available during hot-reload and potentially reducing import resolution time.
- **Dev bundle size:** The module will be part of the dev bundle, increasing its size slightly.
- **Production build:** unknown from the available diff/scan evidence.
- **Runtime behavior:** no new flags or environment variables were introduced, so existing logs and metrics remain unchanged.

Risks & follow-ups

- Verify that `three/webgpu` is listed in `package.json` and installed; otherwise Vite will fail to resolve it during dev.
- Run `vite build` to confirm the module does not unintentionally appear in the production bundle.
- Measure dev server start-up time to detect any marginal performance regression.
- Ensure `three/webgpu` does not conflict with other optimizations such as `needsInterop: ["elkjs"]`.
