

electron/export-snapshot.cjs

Kind: added · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:42:41.187Z

Overview

A new CommonJS module `electron/export-snapshot.cjs` is added. It exposes a single function, `exportProjectSnapshotZip`, that zips a given bundle directory into a specified output path using the system `zip` utility.

Key changes

- **Imports added:** `node:fs`, `node:path`, and `node:child_process` (`spawnSync`).
- **Function `exportProjectSnapshotZip(bundleDir, outZipPath)` :**
 - Resolves and validates `bundleDir`.
 - Ensures the output directory exists (`mkdirSync` with `recursive`).
 - Removes any pre-existing zip file at `outZipPath`.
 - Executes `zip -r -q out .` with `cwd` set to the bundle directory.
 - Throws detailed errors on missing directory or zip failure.
 - Returns `{ zipPath: out, bytes: size }`.
- **Export statement:** `module.exports = { exportProjectSnapshotZip };`

Impact

- **Correctness:** Adds robust validation and error handling for snapshot creation.
- **Maintainability:** Centralizes snapshot logic in a single module, simplifying future updates.
- **Performance:** Uses synchronous I/O and `spawnSync`, blocking the event loop; acceptable for build scripts but not for long-running processes.
- **Compatibility:** Requires the external `zip` binary; absence will cause runtime errors.
- **Observability:** Errors surface as thrown exceptions, making failures visible during CI or manual runs.

Risks & follow-ups

- **Missing `zip` binary:** Verify availability on all target environments; consider bundling a fallback or documenting the requirement.
- **Blocking I/O:** Ensure this module is only invoked in non-interactive contexts; otherwise, refactor to `async`.
- **Path resolution edge cases:** Test with relative, absolute, and empty `bundleDir` / `outZipPath` values to confirm correct behavior.
- **Race conditions:** When multiple processes target the same `outZipPath`, concurrent `unlink/mkdir` may fail; add locking or unique temp names if needed.
