

electron/preload.cjs

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:48:01.058Z

Overview

The preload script now exposes five new IPC-invoked methods via `contextBridge`. These extend the Git and GitHub tooling API surface.

Key changes

- `gitStagePaths` (`ipcRenderer.invoke("git-stage-paths")`) added at line 129.
- `gitStageDistrict` (`ipcRenderer.invoke("git-stage-district")`) added at line 130.
- `exportProjectSnapshot` (`ipcRenderer.invoke("export-project-snapshot")`) added at line 131.
- `gitCommitDetail` (`ipcRenderer.invoke("git-commit-detail")`) added at line 146.
- `githubCommitContext` (`ipcRenderer.invoke("github-commit-context")`) added at line 147.

These entries appear in the `electronAPI` object immediately after the existing workspace-related methods.

Impact

- The API surface now includes calls for staging specific paths or districts, exporting project snapshots, and retrieving commit details from Git and GitHub.
- No existing symbols were removed; the change is additive.
- Consumers can invoke these methods via `window.electronAPI.<method>`.

Risks & follow-ups

- Verify that the main process registers listeners for the channels `"git-stage-paths"`, `"git-stage-district"`, `"export-project-snapshot"`, `"git-commit-detail"`, and `"github-commit-context"`. Missing handlers will surface as IPC errors.
- Add unit tests to confirm that the preload methods forward payloads correctly.
- Run `npm run lint` and `npm run build` to ensure no syntax or type errors were introduced.
