

electron/workspace-history.cjs

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:49:31.961Z

Overview

The file `electron/workspace-history.cjs` was modified to change how workspace state is persisted during history indexing.

In both `indexWorkspaceHistory` (lines 100-174) and `refreshWorkspaceHistory` (lines 188-292) the unconditional `await upsertWorkspace(userData, workspace);` that previously ran on every commit was removed (diff lines 135 and 240).

Instead, a `persistSession` flag is computed: `js i === 0 || i === commits.length - 1 || (i + 1) % 10 === 0` and passed to `upsertWorkspace` as `{ touchSession: persistSession }` (added lines 135-136 and 241-242).

This throttles session updates to the first, last, and every tenth commit.

Key changes

- **Persist-session logic** – `persistSession` is evaluated per commit and supplied to `upsertWorkspace`.
- **Removed redundant writes** – the earlier write at line 135 (and line 240) is deleted, reducing intermediate writes.
- **No API surface change** – function signatures, imports, and exports remain unchanged.
- **Documentation** – module comments still describe the same high-level behavior; no new external API is introduced.

Impact

- **Write reduction** – the number of calls to `upsertWorkspace` during a history build is lowered to roughly 10% of the previous count.
- **Session persistence** – sessions are now updated only at key points, which may affect metrics that count session touches.
- **Test expectations** – any tests asserting a write per commit may need to be updated to account for the throttling.

Risks & follow-ups

- **Session handling regression** – verify that sessions still expire correctly after the new throttling logic.
- **Test failures** – adjust unit/integration tests that rely on a write per commit.
- **Concurrency** – ensure that reduced write frequency does not cause stale state when multiple indexing jobs run concurrently.
- **Documentation** – consider adding a note in the README or docs about the new session-touching behavior for future maintainers.
