

packages/graph-view/src/NovaDiffGraphExplorer.tsx

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T11:11:40.481Z

Overview

In `packages/graph-view/src/NovaDiffGraphExplorer.tsx` the `NovaDiffGraphExplorerProps` interface was extended with four optional fields: `controlledNodeId`, `focusMode`, `enteredFilePath`, and `onSelectionChange`. These additions appear in the diff at lines 31-37 and are purely declarative; the component's rendering logic remains unchanged.

Key changes

- **Interface augmentation** – the new props are declared in lines 31-37 of the interface.
- **Documentation comments** – JSDoc comments describe each prop's intent.
- **Prop propagation** – the spread `...props` in the component's signature passes the new fields unchanged to either `NovaDiffGraphExplorerEmbed` or `NovaDiffGraphExplorerFull`.
- **No runtime changes** – the component's effect hooks, state handling, and JSX output are identical to the pre-change version.

Impact

- **Non-breaking** – all existing consumers compile without modification because the new props are optional.
- **Extensibility** – downstream code can now supply node-selection or focus-mode hints without altering the explorer internals.
- **No performance change** – the diff adds only type information and comments.
- **Documentation** – the added comments improve developer understanding but require no code changes elsewhere.

Risks & follow-ups

- **Type-checking regressions** – any code that destructures `NovaDiffGraphExplorerProps` must still satisfy the updated type; run `tsc` to confirm.
- **Test coverage** – existing tests may need to be updated or new tests added to verify that the new props can be passed without breaking the component (unknown from the available diff).
- **Build validation** – run lint, `tsc`, and the production build to ensure no type errors.
- **Documentation sync** – update public API docs to reflect the new optional props.
