

packages/graph-view/src/__tests__/selectionCluster.test.ts

Kind: added · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T11:13:50.621Z

Overview

A new test file `packages/graph-view/src/__tests__/selectionCluster.test.ts` was added. It imports `vitest` helpers, the `KnowledgeGraph` type, and the two functions under test.

Key changes

- **Imports** added at lines 1-3: `vitest` helpers, `KnowledgeGraph`, and `graphNodeIdsInFile`, `graphSelectionCluster`.
- **Mock graph** defined at lines 5-45: two file nodes (`file:src/a.ts`, `file:src/b.ts`) and two function nodes (`function:src/a.ts:foo`, `function:src/a.ts:bar`). Edges include containment, calls, and imports.
- **Tests** at lines 47-61:
 - `graphSelectionCluster` is called with a file node and the test asserts that the returned cluster contains the file and both functions.
 - `graphNodeIdsInFile` is called for `src/a.ts` and the test checks that the returned array includes the file and its functions.

Impact

Adds unit coverage for the selection utilities, ensuring that changes to graph traversal logic are detected during CI. The mock graph is self-contained, making future updates straightforward.

Risks & follow-ups

- **Schema drift:** If the `KnowledgeGraph` shape changes, the mock will need updating; run `vitest` to confirm.
- **Edge-case coverage:** Only file-level selection is tested; consider adding tests for function-level selection and nested imports.
- **Linting/build:** Verify that the new file passes `tsc`, `eslint`, and the repository's build pipeline.
- **Snapshot drift:** No snapshots are used, so no risk of stale snapshots.
