

src/app/codeCityChromeInsets.ts

Kind: added · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:52:53.459Z

Overview

A new file `src/app/codeCityChromeInsets.ts` (added, change kind: added, line range R1-92) introduces utilities for computing the insets required by the CodeCity UI.

Key changes

- `export interface CodeCityChromeInsets` (lines 1-6) defines `bottom`, `right`, `left`, and `hidden`.
- `export interface MeasureCodeCityChromeOptions` (lines 40-43) adds an optional `dockedControls` flag.
- `rectsOverlap(a, b)` (lines 10-12) checks whether two `DOMRect`s overlap.
- `liftForObstruction(hostRect, obstruction, bottom)` (lines 14-22) returns a new bottom inset when an obstruction overlaps the host.
- `isBlockingModalOpen()` (lines 24-38) scans for several modal/backdrop selectors to short-circuit inset calculation.
- `measureCodeCityChromeInsets(host, options)` (lines 49-92) orchestrates the logic: early exit on blocking modal, gathers obstructions (sheet, activity bar), lifts the bottom inset, caps it, and returns a `CodeCityChromeInsets` object.

Impact

- Provides a typed contract for inset values.
- Early exit on modal sets `hidden: true`, allowing callers to suppress the UI when a modal is open.
- Obstruction handling lifts the bottom inset based on overlapping elements.
- The module is additive; existing exports remain unchanged.

Risks & follow-ups

- **Modal detection** – verify that all selectors in `isBlockingModalOpen` still match the current DOM; a missing selector could cause the UI to render while a modal is open.
- **Layout row query** – the fallback to `.novadiff-graph-embed` may fail if the layout changes; test both paths.
- **Hidden flag usage** – callers must interpret `hidden: true` correctly to avoid rendering the UI when a modal is open.
