

src/app/gitTypes.ts

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:55:17.352Z

Overview

`src/app/gitTypes.ts` now includes a set of commit-detail and GitHub-context interfaces and adds an optional `stagePaths` flag to `PublishExecutePayload`. The changes span lines 125-172 of the file.

Key changes

- `PublishExecutePayload` (lines 125-127) now accepts an optional `stagePaths?: string[]` to specify which paths to stage.
- `GitCommitDetail` (lines 129-142) exposes commit metadata: `hash`, `shortHash`, `subject`, `body`, `authorName`, `authorEmail`, `authoredAt`, `parentHashes`, `filesChanged`, `insertions`, `deletions`.
- `GithubCommitPullRequest` (lines 143-149) and `**GithubCommitIssue*` (lines 150-158) provide minimal PR/issue info (`number`, `title`, `state`, `url`).
- `GithubCommitThreadKind` (line 157) is a union of `"pr_review" | "pr_comment" | "issue_comment"`.
- `GithubCommitThread` (lines 159-166) records a thread's `kind`, `number`, `author`, `body`, `createdAt`, and `url`.
- `GithubCommitContext` (lines 168-172) aggregates arrays of pull requests, issues, threads, and an optional `error` string.

Impact

- Modules importing `gitTypes` now have access to the new interfaces, enabling richer commit and GitHub context handling.
- The `stagePaths` option gives callers finer control over staged files before publishing, potentially improving workflow flexibility.
- No existing exports were removed, so backward compatibility is preserved.
- TypeScript consumers may need to adjust type assertions if they previously relied on the exact shape of `PublishExecutePayload`.

Risks & follow-ups

- Verify that code constructing `PublishExecutePayload` still functions; the new optional field should not break existing logic.
- Ensure downstream modules that consume `GitCommitDetail` or `GithubCommitContext` are updated to use the new interfaces.
- Run the full test suite to catch any lint or type-checking regressions introduced by the added types.

- Confirm that documentation and generated type definitions include the new interfaces for developer visibility.
