

## src/components/AutoCommitWorkspace.tsx

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:58:38.199Z

### Overview

`AutoCommitWorkspace.tsx` now exposes a staging-scope UI, an optional “Review in City” callback, and richer commit-message context that includes structural classification and knowledge-graph symbols. The component’s state and UI have been extended accordingly.

### Key changes

- **Imports** – `classifyCompareRows` and `graphSymbolsContext` added (R6-7).
- **Props** – `onReviewInCity?: (paths: string[]) => void` added to `AutoCommitWorkspaceProps` (R23).
- **State** – `stageSelection` ( `Set<string>` ) and `stageAllFiles` ( `boolean` ) introduced (R55-56).
- **UI** –
  - Staging-scope panel with a “Stage all changed files” checkbox and per-file checkboxes (R298-355).
  - “Review in City” button that calls `onReviewInCity` with the selected paths (R339-353).
  - Docs note area shows the generated documentation bundle path (R129-138).
- **Logic** –
  - `generateDraft` builds `classification` via `classifyCompareRows` and `graphContext` via `graphSymbolsContext` (R110-127).
  - `executePublish` accepts an optional `stagePaths` array derived from `stageSelection` / `stageAllFiles` (R193-194).
  - Commit-message context ( `buildCommitMessageContext` ) now receives `{ classification, graphContext }` (R135).

### Impact

- **Correctness** – Commit messages now incorporate file classification and graph symbols, improving semantic accuracy.
- **Maintainability** – New props and state are typed; UI logic is modularized into separate panels.
- **Performance** – Additional state updates and context calculations add minor overhead only when staging or publishing.
- **Compatibility** – Existing consumers may ignore `onReviewInCity` ; it is optional.

### Risks & follow-ups

- **Regression** – Verify that `stageSelection` persists correctly across repo refreshes.
- **API contract** – `api.readKnowledgeGraph` and `api.writeNovadiffDocs` must be available; otherwise the component should fail gracefully.
- **UI layout** – The added staging panel may affect responsive design; run visual regression tests.

- **Prop usage** – Ensure that spreading `AutoCommitWorkspaceProps` does not unintentionally pass `onReviewInCity`.
