

src/components/CodeCityLegend.tsx

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:58:52.589Z

Overview

`CodeCityLegend` now accepts three optional props— `repoRoot?: string` , `onStageFile?: (path: string) => void` , and `onStageDistrict?: (topDir: string) => void` —and renders additional action buttons for the selected building. The component's signature now spans lines 3-147 instead of 3-121 (see diff lines R11-R13 and R22-R24).

Key changes

- **Props API** – new optional props added at the top of the function signature (diff lines R11-R13, R22-R24).
- **UI actions** – the former "Open diff" block (lines 89-97) was removed and replaced by a `<div className="code-city-selected-actions">` (lines 95-123). Inside this div:
 - "Open diff" button appears whenever `onOpenDiff` is supplied.
 - "Stage file" button appears when both `repoRoot` and `onStageFile` are present.
 - "Stage district" button appears when `repoRoot` , `onStageDistrict` , and `selected.topDirectory` are all defined.Each button's `onClick` calls the corresponding callback with `selected.path` or `selected.topDirectory` .

Impact

- **Backward compatibility** – all new props are optional, so existing callers compile unchanged.
- **Type safety** – callers who wish to use staging features must provide the matching callbacks.
- **UI consistency** – the legend now offers staging actions, improving workflow for users working with a local repository.
- **Performance** – negligible; only a few conditional renders were added.

Risks & follow-ups

- **Missing callbacks** – if `repoRoot` is omitted, the "Stage file" and "Stage district" buttons will not appear, potentially confusing users who expect staging actions.
- **Test coverage** – unit tests should be updated to cover the new action buttons and verify that callbacks receive the correct arguments.
- **Accessibility** – no evidence in the diff indicates ARIA labels or keyboard focus handling; confirm that the added buttons are accessible.
