Overview

`src/components/DocsGraphExploreChrome.tsx` is a new component that renders a Code City settings UI in a portal and can be docked to the graph minimap. It introduces two prop interfaces (`GraphBuildBarProps` lines 18-31, `CityExploreBarProps` lines 33-59), helper logic (`countActiveCityFilters` lines 61-87, `ExpandCornerIcon` lines 90-120), and several UI panels (`CityFiltersPanel`, `CityLinkPanel`, `GraphBuildPanel`, `GraphStatsPanel` lines 122-374).

The floating shell (`CodeCityFloatShell` lines 376-439) manages docked/expanded state with `useLayoutEffect`, `ResizeObserver`, and `MutationObserver`. The top-level `CodeCityExploreSettings` component (lines 444-639) mounts the shell into `document.body`, creates an overlay via `createPortal`, and exposes an `expanded` state.

A deprecated wrapper `DocsGraphActionBar` (lines 641-648) forwards props to `CodeCityExploreSettings`. New imports include `createPortal`, `AnimatedOverlay`, `CodeCityGraphToolbar`, `DocsLinkToolbar`, and `CodeCityLayoutResult`.

Key changes

- Added interfaces `GraphBuildBarProps` and `CityExploreBarProps`.
- Implemented `countActiveCityFilters` and `ExpandCornerIcon`.
- Created panels for filters, linking, build controls, and statistics.
- Built a dockable shell that updates position with `ResizeObserver` and `MutationObserver`.
- Mounted the shell into `document.body` and added an overlay portal.
- Provided a deprecated wrapper for backward compatibility.

Impact

- **UI/UX:** Offers filter, linking, and build controls that can be toggled and docked.
- **Build size:** Adds JSX and portal logic; bundle size increases modestly.
- **Performance:** Uses continuous `ResizeObserver` / `MutationObserver` callbacks; runtime overhead may be noticeable on large graphs.
- **Compatibility:** `DocsGraphActionBar` keeps older imports functional; migration to `CodeCityExploreSettings` is recommended.
- **Observability:** No console logs; layout issues would surface as CSS or positioning glitches.

Risks & follow-ups

- **Layout regressions:** Verify CSS classes (`code-city-float`, `code-city-float--chrome`, etc.) and that the minimap slot receives `data-code-city-expanded`.
- **Observer leaks:** Ensure observers are disconnected on unmount; current cleanup paths cover most cases but should be validated in edge scenarios.

- **Portal mounting:** Confirm `document.body` is available in SSR or test environments; the `code-city-body-mount` div should be appended only once.
- **Deprecated API:** Update documentation and search for remaining `DocsGraphActionBar` imports to avoid accidental use.
