

src/components/GitBlamePanel.tsx

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T11:04:36.568Z

Overview

`GitBlamePanel` now uses a tree-view for file navigation and a modal for line-by-line blame. The component was split into a new `TreeRows` helper (lines 14-100) and a `GitBlameLineModal` (rendered after the panel). File-tree logic is memoized and the UI layout has been reorganized into a card-style panel.

Key changes

- **Imports** – `ChevronDown`, `ChevronRight`, `Folder` icons and file-tree helpers (`buildFileTree`, `collectFolderPaths`, `filterFileTree`) were added; `GitBlameLineModal` was imported. The original `FileText`, `Loader2`, `Search` import was replaced.
- **State** – `relPath` was removed; `expanded` (`Set<string>`) and `selectedPath` were added.
- **TreeRows** – renders recursive file/folder rows, handles expand/collapse, and calls `onSelectFile`.
- **File-tree logic** (lines 137-152) builds a tree from `files`, filters it by `fileQuery`, and auto-expands folders that match the filter.
- **Blame loading** (lines 166-192) sets `selectedPath`, opens the modal, clears `fileContent`, then fetches blame and file content.
- **UI** – the old list was replaced by a card layout (`git-blame-files-card`) and a scrollable tree (`git-blame-tree-scroll`). The modal is rendered after the panel.
- **Error handling** – errors are shown only when the modal is closed (`error && !blameModalOpen`).

Impact

- **Maintainability** – `TreeRows` isolates tree logic; the modal decouples blame display.
- **Performance** – memoized tree building and filtering reduce re-renders.
- **UX** – clearer navigation, modal for detailed blame, consistent loading indicators.
- **Compatibility** – no API changes; only UI refactor.

Risks & follow-ups

- Verify that `collectFolderPaths` expands all matching folders; otherwise files may be hidden.
- Ensure `GitBlameLineModal` receives correct `relPath` and `blame` props; missing data could crash the modal.
- Confirm that the `expanded` state syncs with user interactions; stale state could leave folders collapsed.
- Run lint, unit, and integration tests to catch any missing imports or type errors introduced by the new helpers.
