

src/components/GitHistoryContextPanel.tsx

Kind: added · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T11:04:53.799Z

Overview

A new `GitHistoryContextPanel` component is added at `src/components/GitHistoryContextPanel.tsx` (~587 lines). It renders a three-tab panel for commit details, GitHub context, and actions, and includes helper utilities for date formatting, GitHub URL parsing, and error normalisation.

Key changes

- **Imports** (lines 1-19): React hooks, `createPortal` from `react-dom`, icons from `lucide-react`, types from `../app/gitTypes` and `../app/workspaceTypes`, and `GitBlamePanel`.
- **Exported interface** `GitHistoryContextPanelProps` (lines 23-38) defines workspace data, commit references, flags, and callbacks.
- **Utility functions** (lines 40-88): `formatDate`, `slugFromRemoteUrl`, `friendlyGhError`, `threadKindLabel`.
- **Component** `GitHistoryContextPanel` (lines 89-587) manages state for commit detail, GitHub context, blame overlay, and tab selection.
- **UI**: three tabs—Details, GitHub, Actions—rendered conditionally.
- **GitHub integration**: fetches context via `window.electronAPI.githubCommitContext`, displays PRs, issues, and discussion threads.
- **Blame overlay**: uses `createPortal` to render a `GitBlamePanel` over `document.body`.
- **Action buttons**: set base/head, run semantic compare, review in City, generate docs, and line blame.

Impact

- **API surface**: relies on `window.electronAPI` functions (`gitCommitDetail`, `githubCommitContext`, `gitRepoStatus`). Missing or mis-typed APIs will break the panel.
- **UI**: new CSS classes (`git-history-context`, `git-blame-overlay`) must coexist with existing styles; potential layout interference.
- **Testing**: no existing tests cover this component; unit and integration tests are required.

Risks & follow-ups

- **API availability**: verify that `githubCommitContext` and `gitRepoStatus` exist in the Electron preload; otherwise the panel falls back to error messages.
- **Null handling**: `slugFromRemoteUrl` may return `null`; ensure `repository` state is set before GitHub calls.
- **Portal cleanup**: confirm that `createPortal` is unmounted properly when the component unmounts to avoid memory leaks.

- **Accessibility:** check that tabs and buttons have appropriate ARIA roles; the overlay uses `role="presentation"` but tabs lack explicit roles.
