

src/components/HistoryCompareStrip.tsx

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T11:06:29.384Z

Overview

`HistoryCompareStrip` was refactored to improve the Git history comparison panel.

Key UI changes include a new title markup, additional badges, a live-head toggle, and updated class names that align with the design system.

Key changes

- **Title** – lines L71-73 replaced plain text with `` `tsx

Git history compare

`` - **Wrapper** – line R79 added `git-history-compare-card` to the `workspace-setup-strip` container. - **Labels** – lines R83 and R90 added `git-history-field-label` to the Base/Head labels. - **Badges** – lines R85 and R92-96 insert conditional `` elements next to the selectors. - **Selector segment** – line R137 added `git-history-selector-segment` to the segment class list. - **Live-head input** – lines R145-161 replace the head selector with an input + browse button when `useLiveHead` is true. - **Live toggle** – lines R180-185 introduce a checkbox labeled “Compare base against live dev folder”. - **Compare button** – lines R190-205 update the button’s classes, disabled state, and tooltip logic.

The logic that determines `canCompare` (lines 62-66) remains unchanged.

Impact

- **UI consistency** – new class names (`git-history-compare-card` , `git-history-field-label` , etc.) match the existing design system.
- **Accessibility** – added `aria-label` attributes and descriptive labels for interactive elements.
- **No functional regression** – only presentation layers were altered.

Risks & follow-ups

- **Missing CSS** – verify that the new classes exist in the stylesheet.
- **Badge rendering** – ensure badges do not appear when `base` or `head` is null; run unit tests for edge cases.
- **Live-head toggle** – confirm that toggling updates `useLiveHead` correctly and that the input behaves as expected.
- **Lint & build** – run `npm run lint` , `npm test` , and `npm run build` to catch any syntax or type errors introduced by the JSX changes.
