

src/components/ui/ui-transitions.css

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T11:09:11.877Z

Overview

src/components/ui/ui-transitions.css replaces the hard-coded `flex: 1` on `.workspace-stage` and `.workspace-stage-inner` with `flex: 1 1 0`. A new rule for `.launch-panel--main .workspace-stage` is added. The change is limited to layout properties; no animation or transition rules are modified.

Key changes

- **New selector:** `.launch-panel--main .workspace-stage` (lines 47-50)``css .launch-panel--main .workspace-stage { flex: 1 1 0; min-height: 0; }

```
- `.workspace-stage` (line 48) changed from `flex: 1;` to `flex: 1 1 0;` (diff: L48 removed, R48 added).
- `.workspace-stage-inner` (line 57) changed similarly (diff: L57 removed, R62 added).
- Additional flex: .workspace-stage-inner > .workspace` now has `flex: 1 1 0; min-height: 0;` (lines 70-71).
- No other CSS properties were altered.
```

Impact

- **Layout**: The workspace stages now grow and shrink with a basis of 0, allowing more flexible height distribution within the launch panel.
- **Maintainability**: The new selector isolates the launch-panel layout, reducing accidental style bleed.
- **Compatibility**: No new CSS features or vendor prefixes were introduced; the change should work in all supported browsers.
- **Performance**: unknown from the available diff/scan evidence.

Risks & follow-ups

- **Regression**: Verify that the launch panel still occupies the intended space and that no content is clipped.
- **Overflow**: Ensure that `overflow: hidden` on `.workspace-stage-inner` behaves correctly with the new flex basis.
- **Test coverage**: Run the targeted UI tests for the launch panel and workspace stage; add a smoke test if none exist.
- **Visual consistency**: Manually inspect the layout on different viewport sizes to confirm that the new flex values do not cause unintended stretching or shrinking.
