

vite.config.ts

Kind: modified · Baseline: f7c2bfd81af2 · Target: NovaDiff · Generated: 2026-05-21T10:38:14.511Z

Overview

The Vite configuration now replaces the single `@novadiff/graph-core` alias with three granular aliases for the core package's types, schema, and search modules.

The change occurs in the `resolve.alias` section (lines 15-26 of `vite.config.ts`).

Key changes

- **Removed** the old alias `@novadiff/graph-core` that pointed to `packages/graph-core/src`.
- **Added**
 - `@novadiff/graph-core/types` → `packages/graph-core/src/types.ts`
 - `@novadiff/graph-core/schema` → `packages/graph-core/src/schema.ts`
 - `@novadiff/graph-core/search` → `packages/graph-core/src/search.ts`
- The `@novadiff/graph-view` alias remains unchanged.
- No other configuration sections were modified.

Impact

- **Module resolution:** Imports that previously used `@novadiff/graph-core` must now target the specific sub-modules (`types` , `schema` , `search`).
- **Build correctness:** The new aliases point to individual source files, which is likely to reduce bundle size and avoid accidental exposure of internal files.
- **Maintainability:** Explicit aliases clarify intent and make refactoring of the core package easier.
- **Compatibility:** Existing code that imports `@novadiff/graph-core` will break unless updated; this change is a breaking API shift for consumers of the Vite config.

Risks & follow-ups

- **Import regressions:** Verify that all internal imports now reference the new aliases; run `npm run lint` and `npm test` to catch unresolved imports.
- **Build failures:** Ensure the TypeScript compiler resolves the new paths; run `npm run build` to confirm.
- **Documentation:** Update any README or docs that mention the old alias.
- **CI pipelines:** Confirm that the updated config does not affect server watch ignore patterns or dev server behavior.
