

.gitignore

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:06:11.822Z

Overview

A new `.gitignore` file was added at the repository root (line range R1-38). It contains ignore rules for logs, build artifacts, editor metadata, and tool-specific directories.

Key changes

- Added `.gitignore` (R1-38).
- Excludes log files: `*.log`, `npm-debug.log*`, `yarn-debug.log*`, `yarn-error.log*`, `pnpm-debug.log*`, `lerna-debug.log*` (lines 1-6).
- Ignores build and distribution directories: `node_modules`, `dist`, `dist-ssr`, `packages/graph-core/dist` (lines 10-12, 38).
- Skips editor/IDE metadata: `.vscode/*`, `!.vscode/extensions.json`, `.idea`, `.DS_Store`, `*.suo`, `*.ntvs*`, `*.njsproj`, `*.sln`, `*.sw?` (lines 15-24).
- Excludes Rust CLI target (`cli/target`) and Electron installer output (`release`) (lines 26-30).
- Omits legacy clone directory (`understandanything/`) and temporary folder `Bn` (lines 34-36).

Impact

- Centralizes ignore rules, simplifying future updates.
- Git and CI tools will now respect these ignores; no code changes are required.
- CI logs may be cleaner, but verify that any required artifacts are not inadvertently ignored.

Risks & follow-ups

- Confirm that `packages/graph-core/dist` is not needed in the repo; adjust the ignore if necessary.
- Run the test suite and CI pipeline to ensure ignored files do not affect tests or deployment scripts.
- Verify that the `!.vscode/extensions.json` rule still allows necessary VS Code settings to be tracked.
- Ensure that excluding `understandanything/` does not hide needed legacy files for downstream consumers.
