

electron/novadiff-docs-pdf.cjs

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:28:54.130Z

Overview

A new module `electron/novadiff-docs-pdf.cjs` is added. It generates PDF documentation and diagram packs for NovaDiff bundles by rendering HTML in a hidden Electron `BrowserWindow`.

Key changes

- **Imports** (lines 3-8): `fs/promises`, `os`, `path`, `url`, `electron`, `marked`.
- **Metadata helper** `bundleModeMeta(bundle)` (lines 25-53) centralises labels, narrative titles, and diagram titles for baseline, target, and change-report bundles.
- **Table renderers** (`renderDetectedProjects`, `renderSymbolsTable`, `renderImportEdgesTable`, `renderCrossFileCallEdges`) (lines 69-165) build HTML tables from outline data.
- **HTML builders**
 - `buildMainPdfHtml(bundle)` (lines 174-271) creates a full-page HTML document: Markdown parsed with `marked`, Mermaid blocks, a JSON excerpt, and the tables above.
 - `buildDiagramsPdfHtml(bundle)` (lines 272-314) produces a compact page with only Mermaid diagrams.
- **PDF conversion** `htmlToPdfFile(html, outPdfPath, opts)` (lines 337-378) writes a temporary HTML file, loads it in a hidden `BrowserWindow`, waits for `window.__PDF_READY`, then prints to PDF.
- **Orchestration** `generateNovadiffDocsPdf(bundle, _appRoot)` (lines 384-399) validates `bundle.targetRoot`, builds output paths, and calls the two PDF generators.
- **Exports** (line 401): `{ generateNovadiffDocsPdf, htmlToPdfFile }`.

Impact

- PDF output mirrors the HTML view but requires Electron and network access for the Mermaid CDN; offline builds may fail.
- Rendering each PDF launches a headless browser window, which can be slow for large bundles.
- Temporary directories are cleaned in a `finally` block, but the cleanup must be verified under error conditions.
- No retry logic is present; errors are logged to the console.

Risks & follow-ups

- **Electron dependency:** Ensure the runtime includes Electron and the `BrowserWindow` API matches the used version.
- **Network dependency:** The Mermaid CDN URL (`https://cdn.jsdelivr.net/...`) must be reachable; consider bundling a local copy for offline builds.

- **Temp-file cleanup:** Verify that the `finally` block reliably removes the temporary directory even on errors.
- **Security:** `nodeIntegration` is disabled and `contextIsolation` is enabled, but `webSecurity` is turned off; review if this is acceptable.
