

electron/novadiff-docs-writer.cjs

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:29:32.691Z

Overview

A new CommonJS module `electron/novadiff-docs-writer.cjs` is added to generate a NovaDiff documentation bundle on disk. It introduces helper functions for bundle metadata, writes a set of Markdown, JSON, and Mermaid files, and exports the writer and a constant.

Key changes

- **Imports:** `fs/promises` and `path` are required (lines 3-4).
- **Constants:** `NOVADIFF_DOCS` and `DEFAULT_BUNDLE_KEY` (lines 6-7).
- **Helper functions:**
 - `bundleKeyOf(bundle)` (lines 9-12) normalizes the bundle key.
 - `bundleBaseDir(root, bundle)` (lines 14-16) builds the output directory path.
 - `bundleHeadline(bundle)` (lines 18-26) selects a human-readable headline.
 - `readme(bundle)` (lines 51-93) constructs a README with a table of contents.
- **Main writer:** `writeNovadiffDocsBundle(bundle)` (lines 96-174)
 - Validates `bundle.targetRoot`.
 - Creates the base and `diagrams` directories.
 - Writes README, AI project doc, compare metrics, codebase outline, risk signals, summary/selection indexes, confidence badges, release overview, and Mermaid diagram files (writes at lines 105-110, 112-115, 117-120, 122-125, 127-130, 132-135, 137-140, 142-145, 147-151, 152-156, 158-161, 163-166, 168-170).
 - Returns `{ ok: true, dir: base, bundleKey: bundleKeyOf(bundle) }` (line 173).
- **Exports:** `module.exports = { writeNovadiffDocsBundle, NOVADIFF_DOCS }` (line 176).

Impact

- **Correctness:** Guarantees a fully populated docs bundle; missing `targetRoot` throws an error.
- **Maintainability:** Centralizes bundle generation logic; helper functions aid reuse.
- **Performance:** Uses async I/O; writes files sequentially, which may be a bottleneck for large bundles.
- **Compatibility:** Pure CommonJS; no ES module syntax, so it fits the existing Electron build.
- **Observability:** Returns the output directory and bundle key, useful for downstream tooling.

Risks & follow-ups

- **Error handling:** Only `targetRoot` is validated; other properties are assumed truthy, which could lead to silent failures if omitted.
- **Race conditions:** Concurrent calls to `writeNovadiffDocsBundle` could overwrite files; consider locking or unique temp dirs.
- **Path safety:** `bundleKeyOf` trims and defaults but does not sanitize; malformed keys could produce unexpected paths.
- **Testing:** No unit tests cover this module; add tests for file creation, error paths, and output content.
