

electron/workspace-store.cjs

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:33:45.931Z

Overview

A new CommonJS module `electron/workspace-store.cjs` is added to the Electron side of the app. It implements session persistence and workspace CRUD logic using JSON files on disk.

Key changes

- **Imports:** added `node:fs`, `node:fs/promises`, `node:path`, and `node:crypto` (lines 3-6).
- **Path helpers:** `sessionPath(userData)` and `workspacesRoot(userData)` (lines 8-14).
- **I/O helpers:** `readJson(filePath, fallback)` and `writeJson(filePath, data)` (lines 16-31).
- **Session API:** `loadSession`, `saveSession`, `setLocalOnlyMode`, `listWorkspaces` (lines 33-67).
- **Workspace API:** `upsertWorkspace`, `setActiveWorkspace`, `setGitUser`, `getWorkspace` (lines 74-106).
- **State updates:** `updateWorkspaceUiState` and `updateWorkspaceLiveRepo` (lines 108-145).
- **Creation flow:** `createWorkspace` generates a UUID, resolves repo paths, creates directories, writes `meta.json`, and updates the session (lines 147-177).
- **Exports:** all public functions plus `workspacesRoot` (lines 180-193).

Impact

- **Persistence:** Sessions are stored in `novadiff-session.json` under `userData`; each workspace has a `meta.json` in its own data directory.
- **API surface:** Callers must import from this module to perform workspace operations.
- **I/O:** Every operation reads or writes JSON files; concurrent calls may contend on the same files.
- **Error handling:** `writeJson` uses `rename` for atomic writes, but no file-locking is implemented.

Risks & follow-ups

- **Race conditions:** Concurrent `createWorkspace` or `upsertWorkspace` calls could corrupt `novadiff-session.json` (no locking).
- **Atomicity:** `writeJson` relies on `fs.rename`; verify behavior on all target OSes.
- **Path validation:** `path.resolve` on an empty string throws; the code throws a custom error if the resolved path is empty (lines 151-153, 133-136).
- **Testing:** Add unit tests for each exported function, especially `createWorkspace` and `updateWorkspaceLiveRepo`.
- **Lint & build:** Run `npm run lint`, `npm test`, and the production build to catch any syntax or type issues.
