

# package.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:09:39.017Z

## Overview

A new `package.json` (added at the repository root, lines R1-R100) establishes the NovaDiff monorepo. It declares workspaces, build scripts, dependencies, and an Electron build configuration.

## Key changes

- **Workspaces** – `packages/graph-core` and `packages/graph-view` are added (lines R7-R10).
- **Scripts** – New commands ( `dev` , `rust:build` , `graph:core-build` , `graph:catalog:generate` , `graph:build` , `electron:dev` , `build` , `electron:build` , `preview` , `test` ) appear in lines R12-R21.
- **Dependencies** – Core libraries ( `@dagrejs/dagre` , `@xyflow/react` , `d3-force` , `graphology` , etc.) and workspace references ( `@novadiff/graph-core` , `@novadiff/graph-view` ) are listed (lines R23-R44).
- **DevDependencies** – Electron tooling ( `electron` , `electron-builder` ), Vite, TypeScript, Tailwind, and concurrency utilities are added (lines R46-R62).
- **Electron build config** – The `build` section (lines R64-R99) specifies `appId` , `productName` , `icon` , output directories, included files, extra resources, and platform targets ( `mac` , `win` , `linux` ).
- **Module type** – `"type": "module"` and `"main": "electron/main.cjs"` set the entry point for the Electron main process (lines R5-R6).

## Impact

- **Build pipeline** – `npm run build` orchestrates graph build, TypeScript compilation, and Vite bundling before Electron packaging.
- **Workspace resolution** – Local package references ( `file:` ) require `npm install` to hoist dependencies correctly.
- **Electron packaging** – `electron-builder` will generate installers for the specified platforms; missing assets (e.g., `nova-diff-icon.png` ) will break packaging.
- **Testing** – `vitest` is now a devDependency; existing test suites must run under the new workspace context.
- **CLI integration** – `rust:build` points to `cli/Cargo.toml` ; ensure the Rust target is available before Electron dev.

## Risks & follow-ups

- **Dependency resolution** – Verify that workspace packages resolve without conflicts; run `npm install` and `npm dedupe` .
- **Electron dev** – Test `npm run electron:dev` locally; confirm that the Vite dev server and Electron process start without errors.

- **Build artifacts** – Ensure `electron-builder` produces installers for all target platforms; check `build.files` paths.
- **CI pipeline** – Update CI scripts to include `npm run build` and `npm run test`; confirm that the new `vitest` configuration passes.
