

packages/graph-core/scripts/generate-alphabetical-catalog.mjs

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:06:25.279Z

Overview

A new Node script `packages/graph-core/scripts/generate-alphabetical-catalog.mjs` (added at R1-R5) reads `language-names.txt`, normalizes language names, resolves file extensions and tree-sitter WASM files, and writes a TypeScript module `../src/languages/alphabetical-catalog.generated.ts` containing a sorted array of `LanguageCatalogEntry` objects.

Key changes

- **Imports** (R6-R8): `fs`, `path`, and `url` modules are required to locate the input and output files.
- **Normalization helpers** (R182-R216): `normalizeKey` trims and normalizes display names, handling special cases such as "c++", "objective-c", and "webassembly".
- **Slug generation** (R217-R232): `slugify` creates unique identifiers, avoiding collisions via a `used` set.
- **WASM resolution** (R233-R262): `resolveWasmsKey` maps normalized keys to WASM filenames using an alias table.
- **Extension resolution** (R263-R281): `resolveExtensions` looks up extensions from `EXT_BY_KEY`, with a fallback that scans keys containing the display name.
- **Extension claiming** (R282-R291): `claimExtensions` ensures each extension appears only once across all entries.
- **Entry construction** (R293-R300): For each language, an object with `id`, `displayName`, `extensions`, and optional `wasmsFile` is built.
- **Output generation** (R312-R322): The sorted entries are formatted into a TypeScript module and written to `../src/languages/alphabetical-catalog.generated.ts`.

Impact

- **Build pipeline**: The generated file must be included in the TypeScript build; the CI or build scripts should run this generator before compiling.
- **Runtime**: No direct runtime changes; the script is a build-time helper.
- **Maintainability**: Centralizes language metadata generation, reducing manual edits to the catalog.

Risks & follow-ups

- **Normalization correctness**: unknown from the available diff/scan evidence.
- **Slug uniqueness**: unknown from the available diff/scan evidence.
- **WASM mapping**: unknown from the available diff/scan evidence.
- **Build integration**: unknown from the available diff/scan evidence.
