

packages/graph-core/src/__tests__/change-classifier.test.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:50:36.133Z

Overview

A new test file `packages/graph-core/src/__tests__/change-classifier.test.ts` (lines 1-183) was added to exercise the `classifyUpdate` decision logic.

Key changes

- **Imports** – `vitest` helpers, `classifyUpdate`, and the `ChangeAnalysis` type are imported at lines 1-3.
- **Helper** – `makeAnalysis` (lines 5-14) builds a `ChangeAnalysis` object with default empty arrays, allowing concise test setups.
- **Test cases** – The suite (lines 17-183) covers all decision paths:
 - `SKIP` when all files are unchanged (lines 18-28) or cosmetic-only (lines 31-40).
 - `PARTIAL_UPDATE` for a few structural changes plus new files (lines 42-57).
 - `ARCHITECTURE_UPDATE` when >10 structural files (lines 59-70), new/deleted directories (lines 72-96), or when deleted files raise the structural count (lines 172-182).
 - `FULL_UPDATE` when >30 structural files (lines 124-135) or >50 % of the project is structurally changed (lines 137-147).
 - File-to-reanalyze logic ensures new and structural files are included while deleted files are excluded (lines 149-162).
 - Edge cases: empty analysis (lines 164-170) and counting deleted files toward structural totals (lines 172-182).

Impact

- **Correctness** – the tests assert the expected actions for each threshold boundary, providing immediate feedback if the logic changes.
- **Maintainability** – the `makeAnalysis` helper reduces duplication and keeps the test code focused on behavior.
- **Observability** – failures surface directly in the test suite, making regressions easy to spot.

Risks & follow-ups

- **Threshold drift** – if the thresholds in `classifyUpdate` are modified, the corresponding tests will fail; review and adjust expectations accordingly.
- **Test discovery** – ensure `vitest` is configured to locate the new test file.
