

packages/graph-core/src/__tests__/framework-registry.test.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:54:29.988Z

Overview

A new test file `packages/graph-core/src/__tests__/framework-registry.test.ts` (lines 1-123) has been added. It imports `vitest` helpers and the `FrameworkRegistry`, `djangoConfig`, and `reactConfig` symbols (R1-R4) and contains tests for registration, lookup, detection, and default-registry behavior.

Key changes

- **Imports:** lines 1-4 add `vitest` and framework config imports (R1-R4).
- **Registration tests:** lines 6-11 verify that a framework can be registered and retrieved by ID, and that duplicate registrations are ignored (R6-R10, R93-R97).
- **Language lookup:** lines 13-20 test `getForLanguage` for known and unknown languages, and that the returned array is a copy (R13-R20, R100-R106).
- **Detection:** lines 28-71 cover detection from `requirements.txt` and `package.json`, case-insensitivity, duplicate avoidance, and empty manifests (R28-R71).
- **Cross-language & defaults:** lines 84-98 test that `createDefault` registers all built-in frameworks (10 total, R109-R111) and that frameworks are available for multiple languages (Python, TypeScript, Java, Ruby, Go) (R114-R120).

Impact

- Provides automated verification of `FrameworkRegistry` logic, reducing regressions when the registry implementation changes.
- Ensures that default configuration remains consistent (10 frameworks, multi-language support).
- Test failures will surface during CI, aiding quick identification of registry issues.

Risks & follow-ups

- **Test flakiness:** detection tests rely on hard-coded manifest strings; if external data changes, tests may fail (unknown from the available diff/scan evidence).
- **Future framework additions:** adding new frameworks will require updating the `createDefault` test to reflect the new count and language mappings.
- **Linting/build:** run `npm run lint`, `npm run test`, and `npm run build` to confirm the new file does not introduce style or compilation errors.
