

packages/graph-core/src/ignore-filter.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:25:13.672Z

Overview

`packages/graph-core/src/ignore-filter.ts` adds a reusable ignore filter. The file imports `ignore`, `fs` (`readFileSync`, `existsSync`) and `path` (`join`) at lines 1-3.

A constant `DEFAULT_IGNORE_PATTERNS` (lines 9-70) lists common dependency, build, lock, binary, IDE, and license patterns. An `IgnoreFilter` interface (lines 72-75) exposes `isIgnored(relativePath: string): boolean`.

`createIgnoreFilter(projectRoot: string)` (lines 86-111) builds an `ignore` instance, layering patterns in this order:

1. hard-coded defaults,
2. `.novadiff-graph/.novadiffignore` if present,
- 3.

`.novadiffignore` at the project root if present. The returned object implements `isIgnored` by delegating to `ig.ignores(relativePath)`.

Key changes

- **Imports added:** `ignore`, `fs`, `path` (lines 1-3).
- **Default patterns:** comprehensive array (lines 9-70).
- **Interface:** `IgnoreFilter` (lines 72-75).
- **Factory function:** `createIgnoreFilter` (lines 86-111) with layered pattern loading.
- **Pattern loading:** uses `existsSync` and `readFileSync` to read user-defined ignore files.

Impact

- Provides a single, documented source for ignore patterns.
- Enables consistent ignore logic across graph-core modules.
- Exposes a clean API (`createIgnoreFilter`) for internal use.

Risks & follow-ups

- **Pattern precedence:** later layers can override earlier ones via negation; verify correct behavior.
- **File existence checks:** `existsSync` paths are resolved with `join`; confirm cross-platform correctness.
- **Test coverage:** add unit tests for `createIgnoreFilter` with various `.novadiffignore` contents.

- **Integration:** ensure graph-building components now use this filter and that no legacy ignore logic remains.
